Evaluate, Continue, Transfer or  
Discharge

Practices to enable, educate,  
engage, enlighten, energize,  
empower, and evolve regarding  
recovery, resiliency, and  
rehabilitation

## Program Overview

Meth SSSS is an intensive 6-12 month program that closely monitors participants while they are active in community-based treatment services. Monitoring will include random drug screens, weekly face to face meetings with case/care managers, individual counseling sessions, group meetings & classes, and communication among the members of an inter-agency/disciplinary team from Amador and other organizations who work with you to be successful in recovery.

The purpose of the Meth SSSS Project is to deliver a comprehensive, integrated evidence-based service for adults with methamphetamine addiction. The intent is to stay alive and stay out of jail while having more stability in activities of daily living—choices, control, and change. The program is designed to give at risk individuals hope, help, and healing needed to combat their addiction. The goal of Recovery Support Services (RSS) is to encourage treatment and self-care to facilitate a better quality of life.

Participants are required to attend group sessions, individual therapy, case review updates with the SSSS Team, make progress on personal goals, and be available for random drug testing.

Persons without criminal justice involvement may seek methamphetamine help at the Amador Health Center too. Voluntary self-referrals are welcomed.

## Understanding Methamphetamine Addiction

Methamphetamine (“meth”) is a highly addictive stimulant that typically is smoked or injected.

Methamphetamine addiction typically occurs when a person begins to use it because of its powerful enhancing effects on mood and energy, weight loss and appetite suppression, among its other psychological and physical effects. Over time effectiveness decreases, and users find that they need to take higher doses to get the same results and have far greater difficulty functioning and experiencing pleasure without the drug than they did before. Many users report becoming addicted from their first use, marking its likelihood for a spiral of debilitating addiction and harmful physical and mental consequences.

The use of methamphetamine may cause mood disturbances, anxiety, confusion, paranoia, insomnia, anorexia, violent behavior, and severe dental problems.
